

CROSS HARPS ARE INCREASING PRODUCTIVITY:

New Harp Screen designed to allow a wider variety of screening ... And lasts longer

INTRODUCING THE NEW SYMPHONY WIRE CROSS HARP

Until now Harp Screens have only been available on mobile screening plants. Now, with the introduction of Symphony Wires's Cross Harp, Harp Screens can now be fitted to any side tensioned vibrating screen, without modification to the screen body.

A Cross Harp is made up of single stands of straight highly tensioned wire, connected at both ends of the screen with a sheet metal hook. Spacer strips sit over the top of the capping rubbers to maintain correct aperture, this produces a long, uninterrupted slot between the capping rubbers.

BENEFITS OF THE CROSS HARP SCREEN

- Cross Harps increase productivity - more tonnes per hour for each square foot of screen area than any other screen surface.
- Cross Harps make screening of sticky and damp material possible where, screening with a woven product would be impossible - You could be screening a product no one else has been able to offer.
- Cross Harps allow screening at smaller apertures than would otherwise be possible. When screening difficult materials your product could be of better quality than your competition or worth more money per tonne.
- Cross Harps are being adopted in many screening applications/ locations Australia wide. Ask us about our success stories and what Cross Harps can do for you.

CAN YOU AFFORD TO BE LEFT BEHIND ?
